

## GROUP 6 RCV PEDAL

### 1. STRUCTURE

The casing (spacer) has the oil inlet port P(primary pressure), and the oil outlet port T(tank). In addition the secondary pressure is taken out through ports 1,2,3 and 4 provided at the bottom face.

## CROSS SECTION

The construction of the RCV pedal is shown in the below drawing. The casing has vertical holes in which reducing valves are assembled.

The pressure reducing section is composed of the spool (8), spring(11) for setting secondary pressure, return spring (18), stopper 1 (13), spring seat (12) and shim(9). The spring for setting the secondary pressure has been generally so preset that the secondary pressure is 5 to 19 kgf/cm<sup>2</sup> (depending on the type). The spool is pushed against the push rod (19) by the return spring.

When the push rod is pushed down by tilting pedal, the spring seat comes down simultaneously and changes setting of the secondary pressure spring.

1	Casing	11	Spring	21	Set screw
2	Pedal	12	Spring seat	22	Nut
3	Pedal cover	13	Stopper	23	Cam shaft
4	Cover	14	Plug	24	Set screw
5	Bushing	15	O-ring	25	Hexagon socket bolt
6	Cam	16	Dust seal	26	Plug
7	Bellows	17	Rod seal	27	Spacer
8	Spool	18	Spring	28	O-ring
9	Shim	19	Push rod	29	Hexagon socket bolt
10	Spring seat	20	Hexagon socket bolt	30	Plug

## **2. FUNCTION**

### **1) FUNDAMENTAL FUNCTIONS**

The pilot valve is a valve that controls the spool stroke, direction, etc of a main control valve. This function is carried out by providing the spring at one end of the main control valve spool and applying the output pressure(=secondary pressure) of the pilot valve to the other end.

For this function to be carried out satisfactorily, the pilot valve is composed of the following elements.

- (1) Inlet port(P) where oil is supplied from hydraulic pump.
- (2) Output ports(1,2,3 & 4) to apply pressure supplied from inlet port to ends of control valve spools.
- (3) Tank port(T) necessary to control the above output pressure.
- (4) Spool to connect output port to inlet port or tank port.
- (5) Mechanical means to control output pressure, including springs that work on the above spools.

### **2) FUNCTIONS OF MAJOR SECTIONS**

The functions of the spool (8) are to receive the supply oil pressure from the hydraulic pump at its port P, and to change over oil paths to determine whether the pressure oil of port P is led to output ports 1,2,3 & 4 or the output port pressure oil to tank port T.

The spring (11) works on this spool to determine the output pressure.

The change the deflection of this spring, the push rod (19) is inserted and can slide in the plug (14).

For the purpose of changing the displacement of the push rod through the cam (6) and adjusting nut (22) are provided the pedal (2) that can be tilted in any direction around the fulcrum of the cam (6) center.

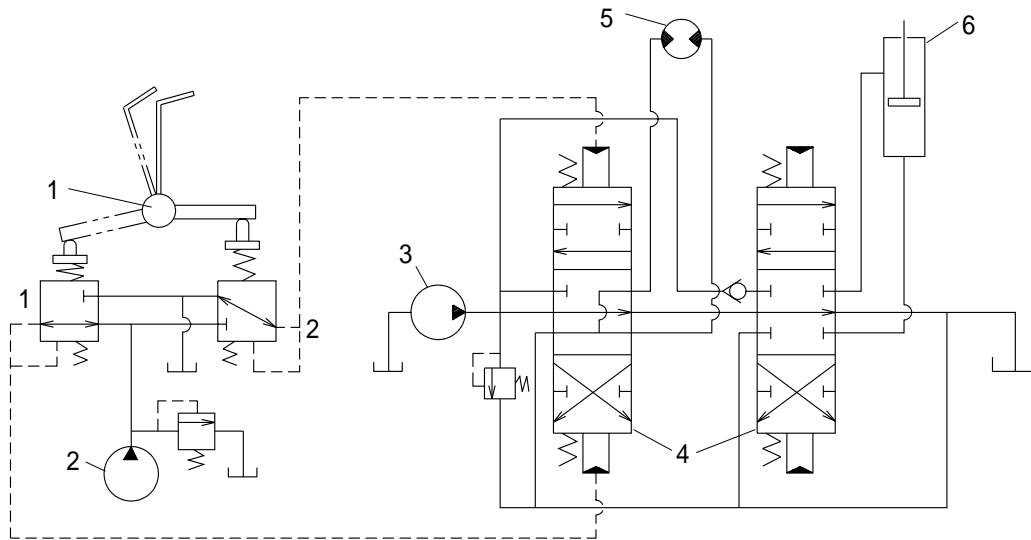

The spring (18) works on the casing (1) and spring seat (12) and tries to return the push rod (19) to the zero-displacement position irrespective of the output pressure, securing its resetting to the center position.

This also has the effect of a reaction spring to give appropriate control feeling to the operator.

### 3) OPERATION

The operation of the pilot valve will be described on the basis of the hydraulic circuit diagram shown below and the attached operation explanation drawing.

The diagram shown below is the typical application example of the pilot valve.

1 Pilot valve  
2 Pilot pump

3 Main pump  
4 Main control valve

5 Hydraulic motor  
6 Hydraulic cylinder

**(1) Case where pedal is in neutral position**

The force of the spring (11) that determines the output pressure of the pilot valve is not applied to the spool (8). Therefore, the spool is pushed up by the spring (18) to the position of port 2 in the operation explanation drawing. Then, since the output port is connected to tank port T only, the output port pressure becomes equal to tank pressure.

## (2) Case where pedal is tilted

When the push rod(19) is stroked, the spool(8) moves downwards.

Then port P is connected with port 1, and the oil supplied from the pilot pump flows through port 1 to generate the pressure.

When the pressure at port 1 increases to the value corresponding to the spring force set by tilting the handle, the hydraulic pressure force balances with the spring force. If the pressure at port 1 increases higher than the set pressure, port P is disconnected from port 1 and port T is connected with port 1. If it decreases lower than the set pressure, port P is connected with port 1 and port T is disconnected from port 1.

In this manner the secondary pressure is kept at the constant value.

Besides, in some type, when the handle is tilted more than a certain angle, the upper end of the spool contacts with the inside bottom of the push rod and the output pressure is left to be connected with port P.
